

# Let's make notifications update in **real-time** by using **ActiveState** instead of **props**:

```
<script>
  const {
    notifications
  } = $props()
</script>

<ul>
  {#each notifications as notification}
    <li>{notification}</li>
  {/each}
</ul>
```

```
<script>
  import State, {subscribe} from 'activestate'
  subscribe('UserChannel', {user_id: 123})
</script>

<ul>
  {#each State.notifications as notification}
    <li>{notification}</li>
  {/each}
</ul>
```

Deeply reactive Svelte 5 state object

# Now we can send notifications through a regular Rails **ActionCable** channel...

```
class UserChannel < ApplicationCable::Channel
  def subscribed
    # TODO: auth
    user = User.find(params[:user_id])
    reject unless user

    state("notifications").set(user.notifications.last(10).as_json)
    stream_for user
  end
end
```
